

## Converting an Atlas steam tram into a working model (2)

**Hugo Baart**

The 009 News recently published an article on converting a static model of the Atlas Berne G33 steam tram into a working model.

I have already done this conversion once, fitting a digital decoder. As it lacks sound, I have now made a second version, using an SD05A sound decoder by Doehler and Haass. I fitted it into the boiler, with a tiny speaker at the front end. In addition I fitted a micro LED for a front light.

The interior and original footplate, with sheet of lead ballast, were fitted into the body from below, so I didn't have to demolish the roof. I forgot about the original coach because I find it ugly as sin....
